# FILTER CAGES AND SLEEVES INSTALLATION MANUAL

## Introduction:

The manual is mainly intended for installers of cages for filter sleeves, for the industrial air filtration. It is intended to suggest how to properly install the product and reduce those behaviors that, in addition to compromising correct installation, can seriously damage the product.

## Recommended accessories and safety devices:

The correct use of all the equipment necessary for the installation of the filter baskets and sleeves is fundamental to reduce maintenance, labor and overall operating costs, as well as avoiding problems during installation. The correct use of the procedures described in the PPE is essential

Gloves

Safety goggles

Protective helmet

Pliers

High visibility jacket

Metal bars

Safety shoes

Wooden bars

## ■ Maximize the duration of the filter sleeves

---

Properly designed cages serve as critical baghouse components for optimum bag performance, durability and longer bag life.

Our cages are constructed of the following materials:

- Stainless steel type S235JR
- Pre-galvanized Stainless steel
- Stainless steel type AISI 304 L (Wr. 1.4301)
- Stainless steel type AISI 316 L (Wr. 1.4404)

## ■ Advantages in using CleanAir cages

---

All the longitudinal bars or wires that compose the cage, are welded on inner rings and inside the I bottoms part and collars.

- Top collars and bottoms parts are molded with rounded edges to reduce abrasion.
- The stringer wires in our cages are consistently spaced so that the cage diameter is the same from top to bottom, promoting proper bag-to-cage fit.
- The top collar is fixed with the wires welded inside, helping to avoid premature bag failure, while the longitudinal wires are welded inside the bottom part, or welded to a terminal ring to which the bottom can be grafted.
- The longitudinal wires are welded to the rings through dedicated and controlled welding processes, to avoid the presence of burrs or sharp parts.

CleanAir has obtained the ISO 3834 part 2 certification (extended quality requirements), the standard dedicated to welding for the fusion of metallic materials, which implements the most restrictive conditions from the qualitative point of view.

## ■ Important instructions

---

It is suggested to pay attention to the instructions below:

1. Locate the symbol printed on the case
2. Follow the instructions provided in the PPE
3. Use the handling and storage manual supplied separately or by scanning the QR code

## INSTALLATION PROCEDURE

### 1° PHASE:

Insert the first part (bottom) of the cage into the tube sheet hole and inside the already installed filter bag with the (slip lok) junction's tongue part pointing upwards.

### 2° PHASE

Insert a metal/wood plank in the cage before the penultimate ring in order to block the cage at the base of the tube sheet

### 3° PHASE

Take then the second part (intermediate or top) of the cage and place the (slip lok) junction's groove part in correspondence with the junction of the cage already inserted into the bag.

## INSTALLATION PROCEDURE

### 4° PHASE

Bring the cage's top (tongue junction) and bottom (groove junction) parts together so that the cracks match with the sliding guide. Then slide the cage's top part (tongue junction) until the end stop is reached.

### 5° PHASE

Keep the cage lifted so that to allow the metal/wood plank removal. Make sure that the plank lays away from the installation area, together with the other devices.

### 6° PHASE

Having removed the supporting plank, lower the whole cage into the tube sheet hole and the filter bag till when it reaches the limit switch; lay the upper collar on the tube sheet and finish to fit the filter bag up to the collar.

## INSTALLATION PROCEDURE

### SUGGESTION!!

---

Make sure that filter cage properly fit in the bag. Ensure that all the devices and packing materials have been removed from the installation area and eventually clean up the zone before activating the plant.
